

# SWINE PRODUCTION

## PREVENTING DISEASE

Rodents are a known carrier for pathogens that can devastate a hog operation: salmonella, trichinosis, swine dysentery, and others. Rats and mice are also a mechanical vector for viruses like PRRS and PEDV, spreading diseases on their bodies and fur.

Rodents can cause significant economic harm to farms – they consume and contaminate feed, and cause damage to structures and electrical wiring.

Place Titan or Bullet iQ Stations around the exterior and interior of buildings to track rodent activity, so you'll know where and when to bait. Use Rat and Live Catch iQ Traps in hard to reach areas where rats and mice travel like attics or drop ceilings.

## INTEGRATED BIOSECURITY MANAGEMENT

Limiting foot traffic and animal contact is a critical part of Biosecurity, particularly on swine operations. Motomco iQ products provide visibility to rodent activity without the need to frequently enter barns or physically check every station or trap. Reduce the risk of contamination and save valuable time and labor costs.

Data gathered by iQ sensors give managers a tool to analyze trends and make adjustments for a more effective rodent control program. Customized reports after every site visit ensure accountability for applicators or service technicians on the farm.

Incorporating iQ Stations and Traps into your facility help ensure a safe and secure environment and provide peace of mind for the producer, integrator and consumer.

“ We've had the iQ stations on our sow facility for a couple months and they work great. It saves me the time not having to check on all the stations and I know where the mice are moving, which helps us out a lot. ”

- Jeff Senne, Farm Manager

## ADVANCED BIOSECURITY = HEALTHY ANIMALS

**THE SMART WAY TO CONTROL RODENTS.**
